

NEHRU COLLEGE OF ENGINEERING AND RESEARCH CENTRE (NAAC Accredited)

(Approved by AICTE, Affiliated to APJ Abdul Kalam Technological University, Kerala)

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

COURSE MATERIALS

CST 205 OBJECT ORIENTED PROGRAMMING USING JAVA

VISION OF THE INSTITUTION

To mould true citizens who are millennium leaders and catalysts of change through excellence in education.

MISSION OF THE INSTITUTION

NCERC is committed to transform itself into a center of excellence in Learning and Research in Engineering and Frontier Technology and to impart quality education to mould technically competent citizens with moral integrity, social commitment and ethical values.

We intend to facilitate our students to assimilate the latest technological know-how and to imbibe discipline, culture and spiritually, and to mould them in to technological giants, dedicated research scientists and intellectual leaders of the country who can spread the beams of light and happiness among the poor and the underprivileged.

ABOUT DEPARTMENT

♦ Established in: 2002

♦ Course offered : B.Tech in Computer Science and Engineering

M.Tech in Computer Science and Engineering

M.Tech in Cyber Security

- ♦ Approved by AICTE New Delhi and Accredited by NAAC
- ◆ Affiliated to the University of Dr. A P J Abdul Kalam Technological University.

DEPARTMENT VISION

Producing Highly Competent, Innovative and Ethical Computer Science and Engineering Professionals to facilitate continuous technological advancement.

DEPARTMENT MISSION

- 1. To Impart Quality Education by creative Teaching Learning Process
- 2. To Promote cutting-edge Research and Development Process to solve real world problems with emerging technologies.
- 3. To Inculcate Entrepreneurship Skills among Students.
- 4. To cultivate Moral and Ethical Values in their Profession.

5.

PROGRAMME EDUCATIONAL OBJECTIVES

- **PEO1:** Graduates will be able to Work and Contribute in the domains of Computer Science and Engineering through lifelong learning.
- **PEO2:** Graduates will be able to Analyse, design and development of novel Software Packages, Web Services, System Tools and Components as per needs and specifications.
- **PEO3:** Graduates will be able to demonstrate their ability to adapt to a rapidly changing environment by learning and applying new technologies.
- **PEO4:** Graduates will be able to adopt ethical attitudes, exhibit effective communication skills, Teamworkand leadership qualities.

PROGRAM OUTCOMES (POS)

Engineering Graduates will be able to:

- 1. **Engineering knowledge**: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
- 2. **Problem analysis**: Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
- 3. **Design/development of solutions**: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- 4. **Conduct investigations of complex problems**: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
- 5. **Modern tool usage**: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and mode ling to complex engineering activities with an understanding of the limitations.
- 6. **The engineer and society**: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
- 7. **Environment and sustainability**: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- 8. **Ethics**: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
- 9. **Individual and team work**: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- 10. **Communication**: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- 11. **Project management and finance**: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- 12. **Life-long learning**: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

PROGRAM SPECIFIC OUTCOMES (PSO)

PSO1: Ability to Formulate and Simulate Innovative Ideas to provide software solutions for Real-time Problems and to investigate for its future scope.

PSO2: Ability to learn and apply various methodologies for facilitating development of high quality System Software Tools and Efficient Web Design Models with a focus on performance

optimization.

PSO3: Ability to inculcate the Knowledge for developing Codes and integrating hardware/software products in the domains of Big Data Analytics, Web Applications and Mobile Apps to create innovative career path and for the socially relevant issues.

COURSE OUTCOMES

CO1	Write Java programs using the object oriented concepts - classes, objects, constructors, data hiding, inheritance and polymorphism
CO2	Utilize data types, operators, control statements, built in packages & interfaces, Input/ Output Streams and Files in Java to develop program
CO3	Illustrate how robust programs can be written in Java using exception handling mechanism
CO4	Write application programs in Java using multithreading and database connectivity
CO5	Write Graphical User Interface based application programs by utilizing event handling features and Swing in Java

SYLLABUS

Module 1

Introduction:

Approaches to Software Design - Functional Oriented Design, Object Oriented Design, Case Study of Automated Fire Alarm System.

Object Modeling Using Unified Modeling Language (UML) – Basic Object Oriented concepts, UML diagrams, Use case model, Class diagram, Interaction diagram, Activity diagram, State chart diagram.

Introduction to Java - Java programming Environment and Runtime Environment, Development Platforms -Standard, Enterprise. Java Virtual Machine (JVM), Java compiler, Bytecode, Java applet, Java Buzzwords, Java program structure, Comments, Garbage Collection, Lexical Issues.

Module 2

Core Java Fundamentals:

Primitive Data types - Integers, Floating Point Types, Characters, Boolean. Literals, Type Conversion and Casting, Variables, Arrays, Strings, Vector class.

Operators - Arithmetic Operators, Bitwise Operators, Relational Operators, Boolean Logical Operators, Assignment Operator, Conditional (Ternary) Operator, Operator Precedence.

Control Statements - Selection Statements, Iteration Statements and Jump Statements.

Object Oriented Programming in Java - Class Fundamentals, Declaring Objects, Object Reference, Introduction to Methods, Constructors, *this* Keyword, Method Overloading, Using Objects as Parameters, Returning Objects, Recursion, Access Control, Static Members, Final Variables, Inner Classes, Command Line Arguments, Variable Length Arguments.

Inheritance - Super Class, Sub Class, The Keyword *super*, protected Members, Calling Order of Constructors, Method Overriding, the Object class, Abstract Classes and Methods, using *final* with Inheritance.

Module 3

More features of Java:

Packages and Interfaces - Defining Package, CLASSPATH, Access Protection, Importing Packages, Interfaces.

Exception Handling - Checked Exceptions, Unchecked Exceptions, try Block and catch Clause, Multiple catch Clauses, Nested try Statements, throw, throws and finally.

Input/Output - I/O Basics, Reading Console Input, Writing Console Output, PrintWriter Class, Object Streams and Serialization, Working with Files.

Module 4

Advanced features of Java:

Java Library - String Handling - String Constructors, String Length, Special String Operations -Character Extraction, String Comparison, Searching Strings, Modifying Strings, using valueOf(), Comparison of StringBuffer and String.

Collections framework - Collections overview, Collections Interfaces- Collection Interface, List Interface.

Collections Class - ArrayList class. Accessing a Collection via an Iterator.

Event handling - Event Handling Mechanisms, Delegation Event Model, Event Classes, Sources of Events, Event Listener Interfaces, Using the Delegation Model.

Multithreaded Programming - The Java Thread Model, The Main Thread, Creating Thread, Creating Multiple Threads, Synchronization, Suspending, Resuming and Stopping Threads.

Module 5

Graphical User Interface and Database support of Java:

Swings fundamentals - Swing Key Features, Model View Controller (MVC), Swing Controls, Components and Containers, Swing Packages, Event Handling in Swings, Swing Layout Managers, Exploring Swings –JFrame, JLabel, The Swing Buttons, JTextField.

Java DataBase Connectivity (JDBC) - JDBC overview, Creating and Executing Queries - create table, delete, insert, select.

QUESTION BANK

MODULE I

			1	
Q:NO:	QUESTIONS	co	KL	PAGE NO:
1	Give the components of use case diagram and its	CO1	K5	15
	purpose. Draw the Use Case diagram of online			
	railway Ticket reservation system.			\
2	Write briefly about any five features of Java.	CO1	K1	14
3	Show the use of different type of operators in Java,	CO1	K3	20
	with the help of suitable examples			
4	Write notes on class diagram, Draw a class diagram	CO1	K2	12
	of an order system			
5	Write short notes on any four object oriented	CO1	K2	02
	Concepts			
6	Differentiate between while and do-while iterative	CO1	K4	23
	statements with example			
7	Construct the following entities as Java classes with	CO1	K6	14
	suitable instance variables and methods:			
	i)BankAccount ii)Vehicle			
	iii)Student			
8	Write note on Use case Diagram .Draw the use case	CO1	K6	08
	diagram of an ATM Machine			
9	Java is called pure object-oriented language. Give	CO1	K5	14
	reasons.			
10	Write a note on Java Virtual Machine	CO1	K2	16
11	Explain the following statements in Java with	CO1	K6	23
	examples.			
	i)switch and for ii)break and continue			
	iii)while and do-while			
	111, 11110 1110 00 111110			

	MODULE II			
1	Write a java program to check whether a given	CO2	K6	34
	number is prime or not			
2	Illustrate constructor with an example program.	CO2	K6	34
3	Differentiate Default and Parameterized	CO2	K4	34
	Constructors with an example.			
4	Illustrate constructor and method overloading	CO2	K4	35
	with an example			
5	Compare private, protected, and public access	CO2	K4	36
	modifiers.			
6	Write a program to print the sum of n numbers	CO2	K6	
	using a constructor . And Point out the			34
	characteristics of the constructor			
7	Illustrate class with its syntax .Also Point out the	CO2	K4	30
	parameter passing in java with an example			
	program			
8	Explain with an example how access modifiers	CO2	K2	36
	are used to control the visibility of identifiers.			
9	Write a program to print the sum of even numbers	CO2	K6	34
	in a Given limit using a constructor.			
10	Illustrate overloading of methods in java. And	CO2	K4	35
	also define a Java class having overloaded			
	methods to calculate area of rectangle and circle.			
	MODULE III			
1	Define an exception with an example? Why it needs	CO3	K1	49
	to be handled			
2	Illustrate any two types of inheritance with an	CO3	K4	56
	Example			

3	Explain try-catch, Nested-try-catch, finally	CO3	K2	51
	Statements with proper examples			
4	Illustrate Packages in Java. List any six built-in	CO3	K4	45
	packages in Java.			
5	Describe the concept of interface in Java.	CO3	K2	58
6	Differentiate between abstract class and interface in	CO3	K4	58
	java with proper example			
7	Develop a java package named prime package, with a	CO3	K6	45
	class Prime containing a static method that check			
	whether a number is prime or not and returns that			
	information. Import this package in another class and			
	use to check a number is prime or not.			
8	With the help of examples, explain how inheritance is	CO3	K6	56
	implemented in Java.			
9	Define package. How is a class within a package	CO3	K1	45
	compiled and executed?			
10	List any four exception classes in Java. Briefly	CO3	K1	49
	explain various exception handling keywords in Java,			
	with examples.			
11	Write the steps and java code for creating a package	CO3	K6	45
	named "AdMath" containing a method to calculate			
	the factorial of a number passed to it. And also			
	mention the Advantage of using a package			
12	Define an exception with an example? Why it needs	CO3	K1	49
	to be handled			
	MODELLE IV			
	MODULE IV			
1	Briefly explain methods used in input and output	CO4	K2	66
	stream classes			
2	Write a program which uses FileReader and	CO4	K6	71

I	FileWriter classes to copy an input file (having			
	unicode characters) into an output file:.			
3	Illustrate two ways of creating threads in java with	CO4	K4	60
	Examples			
4	With the help of proper examples explain thread	CO4	K6	63
	synchronization in java			
5	With proper examples differentiate byte streams and	CO4	K6	66
	character streams			
6	Briefly explain thread life cycle	CO4	K2	60
7	Write a program to find factorial of an integer given	CO4	K6	75
	from the keyboard.			
8	Using exception handling mechanism, display	CO4	K6	75
	appropriate message if the input from keyboard is not			
	a validInteger			
	MODULE V			
1	With the help of proper examples How we can read	CO5	K2	
			112	96
2	and write data from a console			
~	What is thread, write short notes on thread	CO5	K2	96 78
	What is thread, write short notes on thread Synchronization		K2	78
3	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi	CO5		
3	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable	CO5	K2 K6	78 97
	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi		K2	78
3	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable Explain the working of the Delegation Event Model.	CO5	K2 K6 K2	78 97 84
3	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable	CO5 CO5	K2 K6 K2	78 97
3	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable Explain the working of the Delegation Event Model. Explain various string functions with the help of relevant examples Explain event handling	CO5	K2 K6 K2	78 97 84
3 4 5	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable Explain the working of the Delegation Event Model. Explain various string functions with the help of relevant examples	CO5 CO5	K2 K6 K2	78 97 84
3 4 5 6	What is thread, write short notes on thread Synchronization With the help of examples explain creating multi thread using runnable Explain the working of the Delegation Event Model. Explain various string functions with the help of relevant examples Explain event handling	CO5 CO5 CO5	K2 K6 K2 K4 K6	78 97 84 94 95

9	Define swing, What are the advantages of swing over	CO5	K6	104		
	AWT components					
10		G0.5	110	110		
10	Explain the steps using java code for connecting a	CO5	K2	110		
	Java program to a database using JDBC API					
11	List any steps involved in connecting Java to the	CO5	K1	114		
	Database					
	· ·

MODULE NOTES Page xiii CSE DEPARTMENT, NCERC PAMPADY

MODULE - I -> Object Oxionted Concepts * Object Oriented Systems Development life cycle -> Unified Modelling Language * UML Class diagram * Use-case diagram > Java Overview * Java Vietnal Machine 3.9 (38) * Data types 4.4 (46) * Operators * Control statements. * Introduction to Java programming Question Bank: 1- Explain the declaration of every variable in Jova. What is dynamic initialization? give examples. 2. What is meant by polymorphism? Briefly explain the types of polymorphism.

3. What is the o/p of the code? Justify.

class Tests

public static void main (string al]) { byt b = 50;

6 = bx 2;

System. out print (b):

Ans: 100

4. Emplain object orientation concepts buefly.

5. List graphical diagrams defined by UML & illustrate with eg.

6. Describe the looping that starts in Jana.

Object Oriented Concepts:

Object Oriented Programming (OOP) is an approach to program organization & development. OUP treats data as a cartical element in the pam development & doesn't allow it to flow freely around the slm. OOP allows us to decompose a problem into a no. of entities called Objects & then build data & functions around these

Features of OOP:

eatures of OOP.

-> Emphasis on data sather than procedure.

-> Programs are devided into what are known as Objects.

-> Data structures are designed such that they charact-

exise the objects.

-> Methods that operate on the data of an object are field together in the data structure.

-> Data is hidden and of commot be accessed by external fors.

-> Objects may communicate with each other through methods.

-> New data & me thous can be easily added whenever

-> Follows bottom-up approach in pgm design.

1. Objects & Classes: Objects are the basic suntime entities in our object-oriented system. Eg: person, place, Account etc. When a pom is executed, the objects interact by sending mags to one another. Each object contains desta & code to manipulate the data. Objects can interact without having to know the details of each other's data or objects.

The entire set of data & code of an object can be made a user defined data type using the concept of a class. A class may be data type & an object may be variable of that class.

Person — Object

Name — Data

Basicky

Salaryc) — Methods

Taxe)

Data Abstraction & Encapsulation:

The everapping up of data & methods into a single unit is known as encapsulation. The data is not accessible to the outside world & only those methods, which are unapped in the class, can access it. These methods provide interface blw object's data & the pgm.

Information" in" Data & Information

Method

Abstraction refers to the act of representing essential features curthout, including the background details or explanations. Classes use the concept of abstraction & are defined as a list of abstract attribute such as size, weight & cost & methods that operate on these attributes.

Tage No.

Inheritance: Inheritance is the process by which objects of one class acquire the properties of objects of another class. Inheritance supports the concepts of hierarchical classification. -> provides idea of reusability. we can add additional features to our excisting class without Person modefying it. This is possible by deriving a new class from existing one. The new class Attributes: Name will have the combined features DOB of both the classes. studen (-Employee Attributes: AHributes:

Polymorphism: is the ability to take more than one form. An operation may exhibit different behavious in diff. instances. The behavious depends upone the types of data used in the opp.

Shape

Corde Objt- Brands Draw (friangle)

Draw (friangle)

A general class of op's may be accessed in the same manner even though specific acknows associated with each opr may differ. Dynamic Binding, refers to the linking of a procedure call to the code to be executed in response to the call. The code associated with a procedure cell is not known until the time of the call at suntime. Message Communitation: > set of objects communicate with each other. 1. Creating classes that define objects & their be havious. 2. Creating objects from class definitions. 3. Establishing common among objects. Eg: Employee salary (name); objt Information.

Object Oriented Systems Development Life Cycle:

Phases in Object-Oriented Software Development.

The major phases of systems development wing

object oriented methodology are

1. Object oriented Analysis 2. Object oriented design

3. Object oriented implementation.

L'Object Oriented Analysis: In this phase, the pblm is formulated, uses againsts are identified, & then a model is built based upon seal world objects. The analysis produces models on how the desired 8/m should function & how it must be developed. The models do not include any implementation details so that it can be understood & examined by non-technical apply expert.

2. Object - Ouented Design: includes 2 main stages, namely 8/m design & Object design.

System design: The complete architecture of the desired slm is designed. The slm is conciened as a set of interacting subsystems that in tuen is composed of a hierarchy of interacting objects, grouped into classes. System design is done acc. to both the 3/m analysis model & the proposed slm architecture. The emphasis is on the objects comprising the 3/m reather than the processes in the slm.

Object Design: In this phase, a design model is developed based on both the models developed in the 8/m analysis phase & architecture is designed in the 8/m design phase.

All classes required one identified. The designer decides whather

- new classes are to be created from scentch

- any excisting classes can be used in their original

Cage No.

- new classes should be inherited from the existing classes.

The associations blu the identified classes are established & the hierarchies of classes are identified. Developer designs the internal details of the classes & their associations ie; data structure for each attribute & the algor for ops.

Object Oriented implementation & Testing: In this phase, the design model developed in the object design is translated into code in an appropriate programming lang. or s/w tool. The databases are created & specific klow egmnts are ascertained. Once the code is in shape, if is dested using techniques to identify & semone

Unified Modelling Language

A model 18 an abstract representation of a s/m constructed to understand the s/m before building or modifying it It provides the blueprists of the s/m.

The Unified Modeling Language (UML) is a graphical language for visualizing, specifying, constanting & documenting the aetifacts of a s/w intensine 8/m. - UML 18 a language: Communication b/w conseptus

- VML vienalizes - graphical & deschial Rep.

- UML specifies - specifich of analysis, design & ingli - UM L' documents - esce code, astifacts about

egents, Aschitecture, Design, source code, project plans et

My contains 3 kinds of building blocks:

* Things: abstractions, Relationships he things together.

Diagrams group cell of things.

They are * Structual things: Nouns & static parts of Model 7 things are Class, Interface, Collaboration, Uselase Active class, Component & Node. * Behavioral Things: They are verbs & Dynamic parts of UML. They are interaction & State Machine. * Grouping Things: They are organizational parts of UML. Package is a grouping thing.

* Annotational Things: They are explanatory parts of models. A Note is an en example for it. * Relationships: Relationship is a semantic connection among elements. The diff kinds of Reliships in the UML are Dependency, Association (Aggregation), Generalization & Realization. * Dragrams: The sine graphical deagrams of CML are classified into static & dynamic diagrams. Static/Structural Dynamic/Behavior 1. Class Dragram 1. Use Case Diag. 2. Interaction Diag. 2. Object Diagrem - sequence Diag. 3. Implementation Diag.
- Component - Collaboration Diag. 3. State chart Diag. - Deployment. 4. Activity Diag.

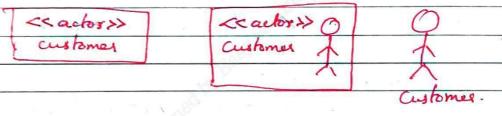

Use Case Diagram:

* Use Case: - A) use case is an end-to end process description that includes many steps or transactions; it is not an individual step or activity in a process.

* Actor: An actor is a user playing a loke cu.r. to the s/m. A single actor may perform many usecases. An actor may be an external s/m that needs some inf " from the aucent s/m.

* Use Care Dragram: used to indicate the existence of use cases, actors & their lelationships. & courses of achons can be performed - quickly understand the external actors of a s/m & the best ways in which they can be used .

* Identifying Actors: A uses may play more than one lote. An actor should represent a single use.

Actor notations. * Identifying Use Case:

- The processes, tasks, functions initiated or participated, performed by each actors are identified. The usecase should represent a course of events leading - The external events that a s/m must

suspond to one identified.

- Name of the asecases should provide a general description of the use-case function.

Eg: Hospital Information System.
Actors: Doctor, Lab Technician, Patrent, Duly Nouse, Recephonist, Visitors. Appointment Maintain history Report Receptonist Fee Payment Relationships: -Communication: Connecting the actor symbol to the wecase symbol with a soled path shows the comm el'ship of an actor in a use case.

- Uses: It occurs when the usecesses have some subflows. - include: A usecase continues description of behavious, by including another usecase. - Extend: when a slm has a sub usecase. eign: exceptions. Appointment) << include >> closify type of apptont <<uses>>> < includes << extend>> Doctors Available lity Comcel Cotlect preinfor Kincludes) Fix appointmed 10

Pige No: Generalization: Relationship a usecase/actor & the usecase/actor. Sub usecases inherits behavious of parents. Volidate X zeinchuless Kinches ? hpatient Out patient UML class Diagrams: The class defines what object can do. A class diagram descentes the types of objects in the s/m & the diff. types of relationships that exist among them. UML class diagram gives an overview of a s/m by displaying classes, attributes, opre & their relationships. Class diagram helps construct the code for the slw apple development. Benefits: - Class diagram illustrates data models for even very complex inf n 8/ms. - provides an overview of how the apply is structured before studying actual code. Easily reduce maistenance time. -helps better understanding - drawing detailed charts for coole.
- helps developers & stake holders. Elements of class Diagram: * Class Name & Attarbules * Operations Class Name

operahai

Class Name: I needed for graphical seps.
Attributes: is named as property of a class which describes the objet being modeled. Shedent Decived Affribute can be there. Namo: Address: for eg: Age from DOB. DOB Relationships: 1. Dependancies 2. Generalizations 3. Associations Dependancy: the relation blu 2 or more classes in which a change in one may force changes in the other.
-indicates one class depends on another. 8 hident --- Callege generalization: connect a subclass Vehicle to its superclass. Subclass inherited from its superclass. 2 To hecles Association: Specialization: Specific features of a set of objects that have not been distinguished by the classes already defined. Association: static relationship b/w classes A & B. For eg. Autiplicity: specifies the association is I student mandatory or not. * shedies College

Pige Ng : Date :

Aggregation: is a special type of association that models a whole-part relationship blu aggregate & to college - student The college will Remain even if the student is not available.
Composition: special type of aggregation which denotes
strong ownership blu 2 classes when one class is a partie another class. College College is composed of classes student. The college could contain many students - each student belong to only one college. Department assigned Customer Order dote: Date name: string Location: string number: String Sendordul) confirm() reciene Order () Generalization closer) Speia Order Normal Order date ! Date date : Date number: String ncumber: String confirm () confirm() dispatch() dispatche) lecrene ()

JAVA OVERVIEW

Java features: 1. Compiled & Interpreted: First Java compiler translates source cools into bytecode instructions (not m/c inst?s). Second Java interpreter generales m/c cools that can be directly executed by the m/c. 2. Platform-independant & Portable: Java pgms can be easily moved from one computer s/m to another, anywhere, any time. Changes & upgrades in O.S., processors & slm
resources will not force any changes in Java frograms.
3. Object Oriented: All pan code & data reside within objts
& classes. The object model in Vava is simple & easy to extend. 4. Robust & Seure: It provides safeguerds to ensure seliable code. It has strict compile time & suntime checking for data types. Java incorporates the concept of exception handling which captures series errors & chiminates risk of crashing the system. 5. Distributed: creating apply on networks. It has the ability to share both data & programs. 6. Simple, small & Familias: Java doesn't use pointers, preprocessor header files, go to statement & many others.
It also eliminates operator overloading & multiple inherten 7. Multithreaded & Interactive: Supports smultiphreaded peograms. - No need to want for the application to finish one task before begining another.

- support- multiplocess syncheonization & construct interactine 8/mg.

8. High performance: - due to the use of intermediate byte code. Reduces overheads during suntime.

9. Dynamic & Extensible: capable of dynamically linking in new class libraries, methods & objects. Java supports functions written in other long, such as C, C++. These for are called native 10. Ease of Development: reduce work of the prog. rammer by shifting the responsibility of creating the lecisable code to the compiler. Java Program Struction -> Documentation Section -> Package 8tm + &: package shudent; -> Import 8tmts. import student test; -> Interface starts -> Class Def's. -> Main method class Main method Def? Java Tokens: Reserved Keywords, Identifiers, Literals Operators, Separators. Implementing a Java Program: 1. Creating the Program Eg: Class Test public static void main (String args []) 2 8 ystem.out-peintln(" Hello");

Program must be saved in a file colled Tast yava. ensuing that the file name contains the class name 2. Compiling the Program - lum java Compiler javal javac Test java the javac compiler creates a file called Test. class containing bytecodes of the pgm.

3. Running the pgm. - At the command prompt, Java Test the interpreter looks for the main method in the & begins ext from there. Java Virtual Machine: Virtual Machine Jara Java Java Compiler produces an intermediate code known as bytecode for a mile that doesn't exist. This MIC is called Java Virtual Machine & it exists only inside the computer memory. The virtual machine code is not m/c specific code. The M/c specific code is generated by Java interpreter by acting as an inter-mediary b/w virtual m/c & real m/c. Machine Java Interpretes Bytecode Real M/c. Virtua

Page XI Layers of interactions for Java programs Real m/c Flamework Use Appl Pams Data types: Data types in Java peinitine Non princhine Amuje Numelic Non numelic Character Bodean Integer types: can hold whole sumbers Java supports Integer 0 8 byte ey: 123L 1231

Tage No :

Floating point Types: numbers containing fractional parts. floating point float double (8 bytes) (4 bytis) Character Type: character constants in memory.

— size of a bytes but single character.

Boolean Type: when we want to last a particular cond during the ext of the pgm. Two values that a boolean type can take true or false. Declaration of raciables type variable 1, ... variable n; Gering values do Variables: variable name = value; hype variable rame = Value; int finalvalue=100; char yes = 'x'; double total=75.36; public static void main (string args []) defines method mein() - starting pt. of ext.

public - access specifies that declares the main method accessible to all other classes. not a post of any obts of the class.

void: moin method doesn't return any value simply prints to the screen. Reading data from keyboard import java. io. Datalnout Stuam; Class Reading

1 public static void main (String ags []) DataInputStream In - new DataInputStream (Systemin); int int Number = 0; float floatNumber = 0.0f; Lystem. out. paintln ("Ete an Integer");

topt int Number - Integer parse Int (in read ine ());

System. out. paintln ("Ete float number");

"I where - Float-value Of (in read ine ()). float Value (); catch (Exception e) { } System. out. peintln ("int Number = " + intNumber"); System out paintin ("float Number = "+ float Number"), Output Ete an integel Eta a Stoat Number 123.45 int Number = 123 float Number = 123-45

Operators Java operators classified into 1. Anthmetic Operators, 2. Relational 3. Logical 4. Assignment 5. Increment and Decrement 6. Conditional 7 Bitwise 8. Special Operators. Authoratic Operators: +,-,+,/,% Integer Authmetic: a/b, when a & b are integer types gives the result of division of a byb after truncating. the divisor 5/2 = 2. (a=5, b=2) Module division %: a % b = a-(a/b) * b Real Authmetic: Modulus operator % can be applied to the floating point equivalent of integer division. flout a = 20.5F, b= 6.4F; Mixed mode Ferthmetic: When one of the operands

Mixed mode Ferthmetic: When one of the operand is real & the other is integer, the expression is called a mixed mode arithmetic expression. If either operand is the real type, then the other operand is converted to seal & the real authoretic is performed.

15/10= 1

Kelational Operator: either side of a relational operator, the certhmetic expressions excuil be evaluated first. Aerthmetic operators have higher perority over relational operators. Logical Operators:

LL, 11, 1 -> Logical AND, OR, NOT Eg: ab fl x==10 Assignment Operators: (=) S=a+b; -to assign value of an exp. to a variable.

V op = escp; //shorthand assignment operators. V op = exp 19 eqt. to V= V op(exp);

varcessed only once. oc+=y+1; //x=oc+(y+1); x = 3; //x = x + 3;a=a*(n+1); = a *= n+1; a=a/(n+1); => a/= n+1; 3 advantages: - what appears on the left hand side need not be repeated

- more consise & eary

- more efficient code. Increment & decrement Operators: ++ 6 --

Thus

Class Increment Operator & public static void main (String arge[]) I int m=10, n=20; System.out. paintln (" nr = " + m); System. out println ("n="+n); System out println ("++m =" #++ m); System out printly ("n++="+ n++); System. out println ("m=" + m); System.out. paintly ("n="+n); tput: m=10 Conditional Operator: 9: exp1? exp2: exp3 Eq: a=10; b=15; n=(a>6)? a:b; if Carbo Bitwise Operators: €, !, 1 (xOR), ~ (NOT), << ,>>, >>> (8heft eight with zero fill) Special Operators: Instance of Operator: Eg: person instance of student is true if object person belongs to the class student

Module II

-> Classes fundamentals

-> Objects

-> Methods

-> Constructors

-> parameter passing

-> Overloading

-> access Control keywords

Question Bank

1. White note on access etal keywords in Java-

2. Explain overloading in Java with eg.

3. Explain parameter passing in Java with suitable og.

Describe the use of constructor in Java with eg:

5. Listout Java features.

6. Define constructor

7. Demonstrate method overloading

Explain parameter passing methods in Java.

9. Explain constructor & explain its category with eg.

Explain Concept of class with eg method constructor overboading & operator overboading in Java.

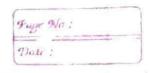

12. Explain Overboading in Java.
13. Illustrate control storts in Java with eg.

1. Explain how access modefiers are used to ctel the visibility of identifiers.

2. Define a Java class having overboaded methods to calculate area of rectangle & circle.

3. Use of constructors with examples.

4. Is it possible to create an object for class A using, Azob A ob = new A(); If the Elass contains only parametersed constructor? why?

Classes fundamentals:

Defining a class:

- class 18 a uses de fined clata type class class name [extends superclass name]

[fields declaration]

? [methods declaration]

Fields declaration

Data is encapsulated in a class by placing data fields inside the body of the class definition. These variables are called instance variables.

Eg: Class Rectangle

int length;

int breadth;

Instance variables also known as member variables.

Methods

Hethods are declared inside the body of the class but immediately after the declaration of instance variables.

type method name (parameter list)

method body;

4 basic parts: method name, esturn type, parameterlist body of method.

Derty: Eg: class Rectangle
Lint Length, width;
void getData (int x, int y) length = oc; width= 9; int rectArea() ¿ int area = length * breadwidth; return area; class Access > Instance variables & methods of x; in classes are accessible by all methods in the class by but void method() a method cannot access the Eint y; variables declared in other x=10; 1/legal methods. 8= 2c; 1/ legal void method 2() { int z; JC=5; Z= 10; y=1/lillegal

Page No:

Object 3

operator. The new operator creates an object of the specified class & returns a reference to that object. eg: Rectangle rect 1; // declare object recti=new Rectangle (); Ilinstantiale Object

Achon Statement Result

Rectangle rect! [null] rect 1 Declare

Instantiale rect = new Rectangles;

> Rect is a seef to Objet Roctangle objt.

Both starts can be combined into one Rectangle rect = new Rectangle (); Rectangle rect 2 = new Rectangle ();

Accessing class Members:

Since we are outside the class, we cannot access the instance variables & the methods directly we musto use concerned object & the dot operator objt name · variablename = value; Objt name methodname (pasameter-list);

The instance variables of the Rectangle class may be accessed & assigned values as follows.

rect 1. langth=15; rect1. width=10;

rect 2. length = 20; recte. width = 12;

rect 1. length 15 rect 2. lugth 1 rect 2. width Another Emore convinuent way of assigning value to the instance variables is to use a method that is Lared & inside the class.

- the method getData cem be used.

Rectangle reet = new Rectangle ();

rect. getData (15, 10); I calling method using the objt. declared a inside the class. The code creates rect 1 objt & then passes in the values 15 & 10 for the x & y parameters of the method void getData (int x, int y) 2 length = x; width = y; Eg: Pgm Class Reetangle & int length, width void get Data (int x, int y) length = 20; int rectArea () & int area = length * width; return (area);

Page No :

Date :

class RectAsea ¿ public static void main (string args []) 2 int areal, areaz; Rectangle rect = new Rectangle (); Acreating Rectangle rect = new Rectangle (); Object Moct 1. width=10' rectof. length=15; area 1 = rect 1. length * rect 1. width; rect 2. get Data (20,12); aread = rect 2. rect Area (); · System-out printly ("Area) = " + owear) System out printly ("Areado" + alead); Output: Area 1 = 150 Area 2 = 240 Constructors: All objects that are created must be given initial values. Java supports a special type of method, called a constructor, that enables as object to initialize itself when it is created. Constructors have the same name as the class itself. They do not specify a leturn type, not even void. They return the instance of the class itself. int rectAsea () class Rectangle ? int length width; z return (length * width); Rectangle (int x int y) = { length = >c; width = y;

Class Rectangle Area

E public static void main (string args []

E Rectangle rect = new Rectangle (15, 10); H calling
int area = rect 1. rect Area [; Constructs

System-out-print by ("Area [="+ area 1);

3

Methods Overloading

It is possible to create methods that have some name, but diff parameter lest & diff. obefine definitions. This is called method overloading. Method overloading is used when objects are required to perform similar tasks but using diff. i/p parameters. When we call a method in an object, Java matches up the method name first & then the no. & type of parameter to devide which one of the def & to execute. This process is known as polymorphism.

Eg: class Room

E float length;
float breadth;
Room (float x, float y)
E length = x;
breadth = y;

{ length=1; breadth=1;

Room ()

Room (float x)

2 length = breadth = x;

int area().

E letuen (length * breadth);

Here we are overloading the constructor method Room(). An object sepresenting a sectoungular room will be created as Room room 1 = new Room (25.0, 15.0); Monstructor) Room room2 = new Room (200); 1/constructor2 Room room 3 = new Room (); 1/ constender 3. Access Control Keywords: /Visibility Control The visibility mode frees are also known as access modifiers. They are - public - private - protected public Access: Any variable or method is visible to the entire class in which it is defined. Eg: public int number; public void sum() friendly Access: When no access modifies is specified, the member defaults to a limited version of public accessibility known as "friendly" level of access. The diff. blu public" & "friendly" access is that public modefier makes fields visible in all classes, while friendly access makes fields visible only in the same packages but not in other packages. protected Access: The visibility of "protected lies in

E subclasses in the same package but also to subclasses

in other packages. Non subclasses in other packages cannot arrest the protected members.

Private Access: private fields - highest degree of proling. They are accessible only with their own class. They cannot be inherited by subclasses & therefore not accessible in subclasses. A method declared as private behaves like a method declared as final.

private protected Access:

private protected int Number;

-visibility level blu protected & private,

-makes the fields visible in all subclasses regardless of what package they are in. These fields are not accessible by other classes in the same package.

Access Modefies	public	protected	frendly	private	private
Acres locations		- 430	(default)		
lame Jass	Yes	Yes	Yes	Yes	Yes
Sume package	Yes	Yes	Yes	Yes	No
other class in same package	Yes	Yes	Yes	No	No
other package	Yes	Yes	No	Yes	No
Non subclass in other package	Yes	No	No	No	No

MODULE III & IV Physics

- 1. Explain the use of packages in Java.
- 2. Weste a note on Stream related classes.
- 3. Define thread synchronization.
- 4 Weste a pan to create a package named mypack, containing a class RightTriangle in which a state method check whether 3 given sides of a triangle forms a right angled to triangle & returns that inf? Import this i package in another class.
- 5. Explain exception bandling mechanism, with suitable examples.
- 6. Weste short notes on Inherstorne with excample. 12

 1. Write a Java pgm that counts no. of words in a text.
- 8. Explain how multiple threads are created in a pgm, with example.
- Illustrate The use of Runnable Interface in Java. Describe how we can create a thread. Explain adv. of multithreaded programming
- Describe the multiple Inhertance with example.
- Weste notes on method overeiding
- Define thread in Java.
- Demonstrate interface in Java.
- Describe abstract classes in Java.
- Nute notes on try & catch statements in gava with a
- 17. Illustrate finally statement & exceptions in Java.
- 18. Describe the concept of stream classes with eg.
- 19. Explain the use of thread class in Java.
- 20. Describe any 6 packages in Java with eg:
- I weste notes or extending interfaces.
- 23. Define phases in lake cycle of a thread.

203.3.
MODULE III.
> Inheritance Basics
> Method Overriding.
> Abstract Classes
>Interface
> Defining & Imposting packages > Exception handling fundamentals
> Exception handling fundamentals
> Multiple catch & nested try statements.
Defining & Importing Packages:
JAVA API provides a large no. of classes
grouped into diff. packages acc. to fnality.
Java
(tang) (uti)
awit net applet
java-lang: - Language support classes. These are classes
that Java compiler itself uses & Therefore They are auto-
metically imported. They include classes for paintine
types, steings, mouth fins etc.
java. util: - classes such as vectors, hash tables, sendom
numbers, date etc.
java. io: - Input/output classes - facilities for i/p & o/pdala.
java. io: - Input/output classes - faculities for i/p & o/pdala. java. awt: - classes for graphical uses Interface. eg: classes
for buttons, lists, menus etc.
Java. net: - classes for networking; classes for communi-
certing with local computers as well as internet servers.
java applet: - classes for weating & implementing applets.

Using 8/m Packages:

Java includes import strats to being cestour classes or entire packages into visibility. import padage name · classname;

import package seme - x;

eg: import java-aut-color; imports the class color & therefore the class name can now be directly used in the

import java. aut. xo; will being all classes of

Java. awt package.

java - package contains aut package - contains classes.

Creating Packages:

-> first declare the name of the partage using the package keyword followed by a package name. Steps: 1. Declare the package at the beginning of a file

2. Define the class that is to be put in the package

& declare it public:

3. Create subdirectory under the directory where the main source files are, stored.

4. Store the lesting as the classrame java file in the subdise ctory created.

5-Compile the file. This creates class file in the subdirectory.

Page No.

The source file should be Using a kakage: named class A. Java stored in the subdirectory package package 1; package 1. Compile javafile. public class ClassA public void display A() Class A. class file 2 System out printly ("class A"); in the same subdirectory impost package 1. Class A; class Package Test 1 I public static void main (string augs []) L Class A object A = new Class A(); object A. display A(); Now let us consider another package named package 2 containing again a single class public class class B 2 protected int m=10; public void desplay B() [System.out. peintle ("Class B"). System. out puntla ("m = " + m); Importing classes from other packages. import package 1. Class A; import package 2. * class Package Testa E public static void main (8tring args [])

[Class A object A = new class A (); Class object B = new class B(); ObjectA. display A(); object B. dus play B(); Igm saved as fackeige Tests. java - compiled & lun Class A class B

Adding a class to a Package:

Eg: package p1; public class A Ellbody of A?

The package P1 contains one public class by name A. -) add another class B to this package.

1. Define the class & make it public.

Dulye De

2. Place the packege short.

package PI; pt public class B

2 11 body of B } 3. Store this as B. java file under the directory pije. 4 Compile B. Java file. This will weate a B. classfile & place it in the desectory pi

import Mytick x Eg: parkage My Pack. dass Past Balance public class Balance 2 public statec void main Estring name; (Strong args[]) double bal; public Balance (string no doubleb) Balance Test = new Balence L'name = n; ("ABC" 99.68) Pest showers public void show () Lif(bal (o) Bystem out-pently (name +": " + bal); Exception Handling Fundamentals: Dealing with Errors: . An error may produce an incorrect o/p or may terminate the esen of the pgm abruptly or even cause the 3/m to crash. -> Compile time estols -> Run time enors. Compile time essors: All syntax errors will be detected & displayed by the Java Compiler & therefore errors are known as Compile time errors. Whenever the compiler displays an error, it will not create the class file. It is therefore necessary that we fire all the ceross before we can successfully compile & sun the pgm. Eg: Class Excort

¿ system · out · printen ("Hello Java") // missing;

ELROYI. Java! 7 (; esupected System.out. println ("Hello Java!") leves.

Most of the compile-time errors are due to typing mistakes.

* Mussing semicolons * messing brackets ..

Run time Errors:

Sometime a sgm may compile successfully usating the class file but may not kun properly. Such sgms may produce wrong results due to wrong logic or may terminate due to errors such as stark

Eg: Dividing an integer by zero out of bounds of allay

¿ int a=10; intb=5; int c=5;

System out println ("sc="+x); int y=a/(b+c);

3 system out printly (ag = "+y);

without executing further stats.

Java. long. Authoric Exception: / by zero
at Error 2. main (Error 2. java-10)

Exceptions: An exception 18 a condition that is caused by a sun-time error. in the payor. When the fava interpreter encounters an euror such as deviding an integer by zero, it creates an exception objt & throw it (ie; informs as that an error has occured). Java exception handling is managed via five keywords: try, catch, throws & finally pgm statements that you want to monitor for exceptions are contained within a try block. If an exception occurs within the try block, it is thrown. Your codes can catch this exception Cusing catch) & hundle it in some rational manner. System generated exceptions are automatically thrown by Lava lun-time 8/m. To manually throw an exception, use the legword throw. Any exception that is thrown out of a method must be speuhed as such by a throw clause. Any code that absolutely must be executed before a method setuens 18 put finally block. [11 ble of code to me be montored] catch (Exaption Type 1 excOb) ¿ 11 exception handler for Exception } 2 11 blk of code to be executed before try blk If the exception objt is not caught & handled properly, the interpreter will display an error mag &

will desminate the pgm.

If we want the pgm to continue with the ext of the remaining code, then we should try to catch the exception objt thrown by the error condition & then desplay are appropriate may for taking corrective action. This task is known as exception Handling. The purpose of exception handling mechania is to provide a means to detect & report an exception eixt circumstance so that appropriate action can be taken.

1. Find the polon (Hit the exception) a. Inform that an error has occured (Throw the

3 - Recieve the error inf (catch the exception) 4. Escaption Handling the Take corrective

try block stort that causes an Exception

exception objt.

Theows

cutch blk stoot that bandles the exception

-> try leay word: preface, a blk of wate that is likely to course an ereor condition & "throw" an exception. -> catch blk: catches the exception "thrown" by the try ble & handles of. The catch belle is added immediately after the try blk.

E stort; 3 // generate an exception catch (Exception-type e)

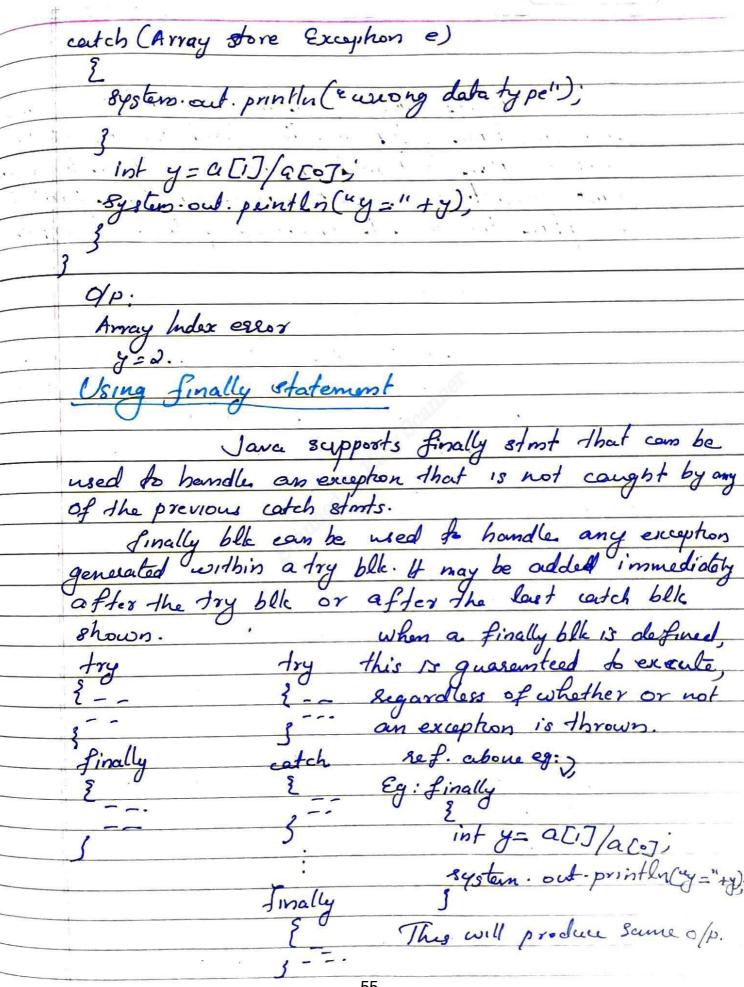

Estatement; 3 11 peocesses exception.

The try ble can have one or more strots that would generate an exception. If any one stoot generates as exception. If any one stool generales an exception, the remaining strots in the blk are skipped & ext jumps to the catch blk that is placed next to the try blk. The catch stort is passed a single parameter, which is sef to the exception thrown. If catch parameter meetines with the type of exception objt, then the exception is and caught & stoods in the catch blk will be executed. class Error3 ¿ public static void main (string ags []) 2 inta=10, b=5, c=5; of se=a/(b-E); // Exception here. catch (Ardbuetic Exception e) E system out printly (" DIVISION by reso"); Bystem. out. println ("y="+y);

Multiple Catch statements. Estat; 11 generales an exceptions catch (Exception-Type 1 E statement; // processes exception by type/ catch (Exception type-2 e) 2 stmt; 3 catch (Exception-Type N e) start; Il processes exception Type II ¿ public state vord moun (strung orgs [7]
¿ int a [] = { 5, 10}; try ? int x= a 1 / b-a (1) catch (Authoritic Exception e) Bystem. out. printly (" Division by zero);

coetch (A reay Indesc Out of Bounds Exception e)

¿ system. out. printin ("Array ludex Error");

Nested try statements

A try start can be inside the blk of another try. Each time a try start is entered, the context of that exception is pushed on the stack. If an inner try start dwesn't have a catch bandler for a particular exception, the stack is unwound & the next try state

Inheritance

→ by creating, new classes & sensing, the properhes of existing ones. The mechanism of deriving a new class from an old one is called inheritance.

The old class is known as the base class or super class or parent class & the new one is called subclass or derived class.

Defining Subclass

Class subclass name extends superclasineme L vouvable declaration; method declaration;

Eg: Single Inheutance: class BedRoom extends Room

Class Room:

Lint h;

Lint langth: BedRoom (int 2, int y, int 2)

int b;

Room: (int x, int y)

E super (x,y); H pass values to super class

E l = x; b = y; 3; h = z;

int area()

E seturn (lxbxh);

E seturn (lxbxh);

class wher Test Epublic static void mais (string agr []) 3 BedRoom . 200m1 = new BedRoom (14, 20, 10); int areal=Room/ areac); int volume 1 = 800m 1. volume (); Bystem.out println ("Area 1=" + area) System. out. printly ("volume 1 = " + volume); Subclass Constructor - is used to construct the instance variables of both the subclass & the Superclass. The subclass constants uses the keyword super to invoke the constructor method of the super class. The keyword super is used subject to the follo. conditions. Method Overriding -when we want an objet to respond to the same method but have deff behavious when that method is called. le; we should overlide the method defined in the superclass. This & is possible by defining a method in the subclass that has same same, same args & same returntype as method in the super class. when that method is called the method defined in subclass is executed. This is known as overriding class B extends A Class A ? int k; Z int is; B (int a, int b, int) A (intay int b) } ¿ super (a,b); I i=aj j=b; g K=c; void show() void show () & system.out.println ("k"+10); Espetim out printintakj +1 + 57j);

Twee his

Class Overvide

[public static void main(string args [])

] B sub ob = new (1,2,3);

sub ob. Show();

Abstract Classes

By making a method final, we move that the method is not redefined in a subclass. is; the method can never be subclassed. We can indicate that the method must always be redefined in a subclass, their making oversiding compulsory.

Eg: abstract class shape

abstract void drawes;

when a class contains one or more abstract methods, it should also be declared abstract.

Interfaces: Multiple loheritame:

Interface defines only abstract methods &

. Interface InterfaceName

Evariables declaration:

Eg: interface Item

2 static final int code = 1001;
static final string name = "fam".

Void displayes;

Estanding Interfaces. Interfaces can also be extended. Le; An 1/f can be subinterfaced from all other yfs. interface name 2 extends name! & body of name 2 Eg: interface Hem Constants stoing name = " Fam"; interface Items extends Hem Constants Evoid displayes ; 3 Implementing Interfaces: class classname implements Interfacename { body of classiane} class classname extends superclass implements interface 1, interface 2. body of cloresname

A pgm contains of or more parts that can sun concurrently. Each part of such pgm is called a thread & each thread defines a separate path of ex?. Thread exist in several states;

-> running, ready, ouspend/resume, wast, terminated.

Thread Priorities:

- how that thread should be treated wir to others. Thread publics are integers that specify the relative priority of one thread to another. A thread's perouty 13 used to decide when to switch from summing thread to the next. This is called context switch.

To set a thread's priority, use the setpriorityes method which is a member of thread.

final void setPriority (int level)

the calling thread. The value of lend must be within the Range UMIN- PRIORITY and MAX- PRIORITY (160). To estion a thread to default priority, spenty NORM-PRIORITY which 18 5. Causest priority can be obtained by calling getPriority() method of Thread.

Creating Thread:

- by instantiating an objt of type Thread.

Two Ways:

> Extending The Thread Class.

Implementing Runnable

only implement a single method called run()

public void Runc) misole sun(), you will define the code that will conshi hite the new thread. After create a class that implements Runnable, instanhale an objt of type Thread from within that class. class New Thread implements Runnable I Thread t: New Thread () { t=new Thread (this, "Demo Thread"): system .out . println ("child thread:"++); public void sunc) 2 for Cint 1=5; 1>0; 1:-) ¿ system. out. punt-la ("Child Thread: "+i); Thread. steep (500); system out puntln ("Exiting child-thread"); class Thread Demo & public static void main(string augs[]) I new New Threach; for (int i=5; 150; i--) 2 system. out. peintln ("Mounthread"); Thread . sleep (1000); system out paintln ("Main thread exeting");

0/0 child thread: Thread [Demo Thread, 5, main] Main Thread 5 MainThread 4 MainThread: 3 Child Thread 5 Child Thread 3 child Thread: 1 Child Thread 4 Child Thread 2 Enting child Thread Mais Thread: 2 Main Thread: 1 Main Thread exeting. t = new Thread (this, a Demo Thread"); Extending Thread class New Thread extends Thread 2 New Threads super ("Demo Thread"); system out println ("Child thread:" +this); public void sum() for (int 1=5; 1>0; 1--) } System.out. peintln ("child Thread: "+i); Thread sleep (500); System. out. println ("Exiting child thread"); Class Extend Thread E public static void main (string args [])

[new NewThread();

for (int 1=5; 1>0; 1--) E system out printles ("Main Thread"+i); Thread sleep (1000); 8ystem. out. paint-lis ("Main thread exiting"); Thread Synchronization Threads try to use data & methods outside themselves. On such occasions they may compete for the same sesousces & may lead to serious problems. For eg: one thread may try to read a second from a fle while another is shill writing to the same the keyword synchronized from a file & the method that will read info file may be declared as synchronized.

synchronized void update: When we declare a method synchronized, Jana creates a monetor & hunds, it once to the thread that calls the method first time. As long as the thread holds the monitor, no other thread can enter the synchronized section of code. It is also possible to mask a blk of code as synchronized synchronized (lock objt)

Pays W. Date: Deadlock Assume that thread A must access the Method I before it can release Methoda but the thread B comnot release Method I until it gets hold of Methoda. Thread A Thread B synchronized methodaco Synchronized methodics synchronized method 20 synchronized methodi() class Callme void call (string mag) Thread. sleep(1000);

System.out.println("]"). Caller implements Runnable public Calles (Callme tagg, 8thing S) 2 target = targ; t= new Thread (this); t. start(); public void hun () 2 tanget call (msg);

Vine VI Salte : Class Synch E public static void main (string ags []). 2 Calline target - new Collmers Caller obs - new Caller (farget, " //ello"). Caller ob = new Caller (target, "synchromed").
Caller ob = new Caller (target, "world"). Obj. pt. join(); Obs t. join(); obs. f. join(); Of [Hello [synchronized [world] By calling sleepe; the calles method allows ex to switch to another thread. This results in mexed-up Of of the 3 mg strings. class Calline E synchronized void call(string mgg) This prevents other threads from entering call () while another thread is using it. [Hello] [Synchronized] [world]

Input Output (Module III)

Files: Storing data on 2° storage devices like disks. The desta is stored in these devices using the concept of files. Data stored in files is called persistent data.

A file is a collection of related records placed in a particular area on the disk. A record is composed of several fields & a field is a group of characters.

Bource Program

(a) Reading data into a pgm

Pgm writes postination Destination (b) writing data to a dest?

Stream Classes

The java in package contains a large no. of stream classes that provide capabilities for processing all types of data.

L> Byte stream classes that provide support

for handling yo op's on bytes.

La Character stream classes that provide

support for minging yo op's on characters.

Event Handling Module IV

Reyboord & various controls such as a push button.

Events are supported by the java aut event package

The Delagation Event Model

- defines standard & consistent mechanisms to

generate & process events. Its concept: a source generates

and event & sends it to one or more listeness. In this

scheme, the listenes sy simply waits control it recieves an

event. Once recieved, the listenes processes the event &

then returns. The advantage is that the appl logic that

processes the event & then returns is clearly separated

from the user iff logic that generate these events. A was

left elmt is able to "oblegate" the processing of an event

to a separate piece of code.

with a source in broke to seciene an event notification.

Here notific are sent only to listeness that want to reciene them.

An event is an object that obscurbes a state change in a source. It can be generated as a consequence of a person interacting with the almost in a CiVI. Some of the activities that cause events to be generated are pressing buttons entering a character via a keyboard, selecting an item in a list a clicking the mouse. Events may also occur that are not directly caused by interactions with a use iff. For eg: an event may be generated, when a timer expires, a counter exceeds a value, a slw or R/w failure occurs or an oph is completed.

Event Sources

event. This occurs when the internal state of that object changes in some way. Sources may generate must than one type of event.

for the listeners to reciene notifications about a specific type of event Each type of event has its own registration method.

The general form:

Here the Type 18 the name of the event of all 18 a reference to the enent lestenes. For ego the method that registers a key board event lestenes is called add Key Listenes is called add Mouse Mokon histones (). The method that registers a mouse motion listenes is called add Mouse Mokon histones (). When an event occurs, all registered listeness are notified and revene a copy of the event objt. This is known as multicasting the event.

some sources may allow only one listener to

public void add Type Listenes (TypeListenes el)
throws java util-TackanyListeners exception

A source must also provide a method that allows a listener to consegister an interest in a specific type of event.

Eg: romone Kespistenes ()

Event Listeness	
A listomer is an object that is notified with	1
an event occurs It has a major requirements.	
-> H must have been sugistered with one or more	L
sources to recieve notifiers about specific types of event	b
-> It must implement methods to review q proun	•
these notifications and are a within	
The methods that revene & process events	-4
are defined in a set of iffs found in java awt in)r
For eg:, the Mouse Motion Listenes interface defines a	
wethods to secreme notifications when the mous 18	
dragged or usual. Any object may recreme & prous on	_
or both of these events if it provides an impl" of	
this interface.	
Event Classes	
classes that represent events are at the	
cole of Java's event handling mechanism.	_
At the not of the Tava event class hierarchy	1
is a EventObject, which is in your cutil. It is the	
superclass for all events 23/13/2011. A 11/13	
EventObject (object sic)	
sac is the objet that generates this event.	
The get Source () method returns the source of the event.)
The get Source () method returns the source of the event.	
It's general form is shown here:	
Object get douse ()	
AWTEVENT is a superclass of all AWT events that are	2_
AWTEVENT is a superclass of all AWT events that are handled by the delegation event model.	

2 190 21) :

Event Classes

An Achon Event is generated when a button is pressed, a list item is double clicked, or a merou item is selected. The Achon Event class defines 4 integer constants - that can be used to identify any modifiers associated with an action event: ALT-MASK, CTRL-MASK, META-IYASK, and SHIFT-MASK.

ActionEvent has these 3 constructors:

Action Event (Object soc, int type, string end)
Action Event (Object soc, int type, string end, int modifies)
Action Event Object soc, int type, string end, long when, intrody

The Adjustment Event Class:

There are 5 types of adjustment events.

BLOCK_DECREMENT - The user clicked inside the scroll bar to decrease its value.

BLOCK-INCREMENT - The user clicked inside the

TRACK - The slider was dragged:

- UNIT_DECREMENT-The button at the end of the scroll bour was clicked to decrease its value. UNIT_INCREMENT-The button at the end of the scroll to increase its value.

Page No:

Sources of Events:

Event souce

Key nest hamlied Button - generates action events when the button is pressed.

Checkbose - when it is selected or discluted.

Choice - when the choice is changed.

List - when an item is double clicked.

Menuttem - when Menuttem is selected.

Sullbar - when swellbar 18 manipulated.

Text components - when the user enters a character.

Window - when a window is activated closed,

deactivated or quet.

Steps in using Delegation Event Model:

I implement the appropriate of in the listener so that it will revene the type of event desired.

2. Implement code to register & unregister the listener as a recipient for the event notific's.

> Demonstrate House Events:

import dova. aut. *;

import dava awt event +;

impost dava applet.x;

<applet code = "Mouse Events" width=300 ht = 100>

</applet>

public class Mouse Events extends Applet

Pgm Mouse event Hundlas Key event handless Event class Descuption - Generated when a button is pressed Action Event a lest item is double-clicked or a memuitans is selected. Adjustment Event - Generated when a seed bas is manipulated Component Event - Generated when component 18 hidden moned resized or becomes visible. Container Event - Generated when component is added or removed from a container. Focus Event - generated when a component gains or loses keyboard focus. Input Event - Abstract super class for all component input event classes. Items Event - generated when a check box or lest item is clicked. Key Event - Generated from when of 13 Revened from key to House Event - Generated when the mouse 18 dragged, moved clicked, pressed, or released. Mouse WheelEvent-Generated when the mouse wheel w Text Event - Generated when the value of a text area Window Event - Generated when a window is activated closed, deachivated or quet.

String Classes (Module IV) > String Class ? defined in java lang. The String Constructors: - suppor string class supports several constructors. To create an empty string

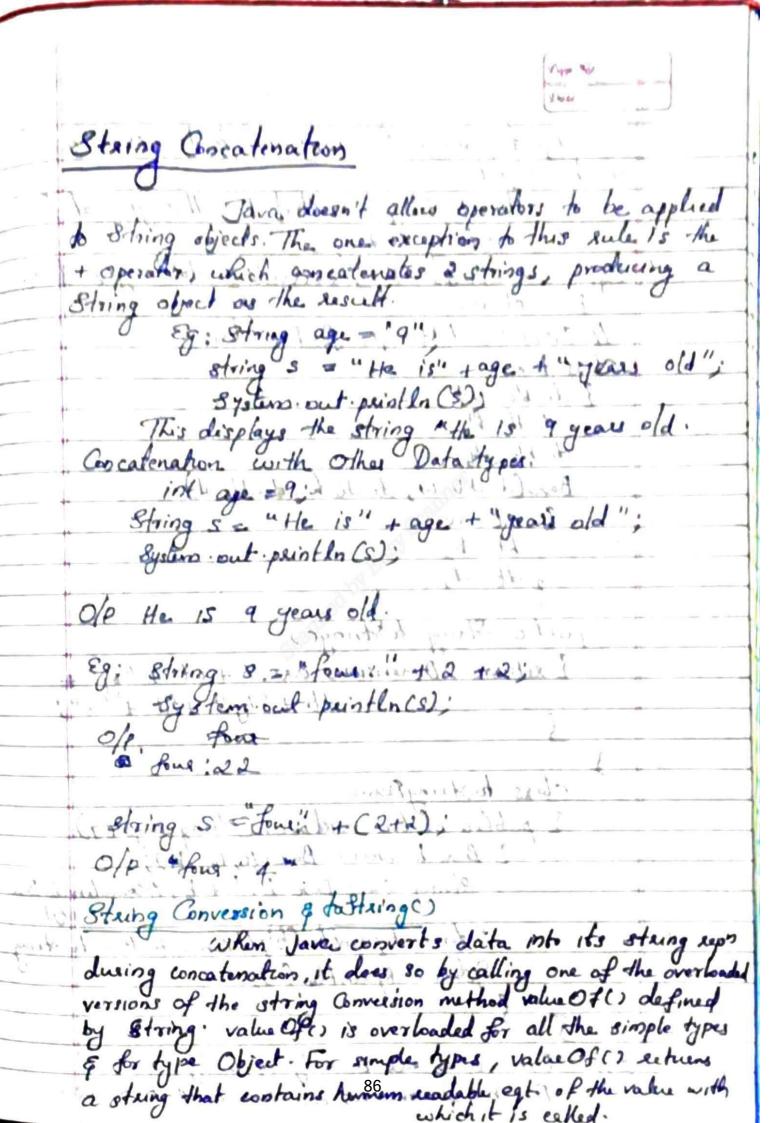

String S = new String will create an
instance St of String with no characters in it.

To create a String initialised by an array of characters use the constauctor String (char chaes () Eg: char chars[] = { 'a', 'b', 'c'}; String s= new String (chars); Il construct one string from another. class MalceStaing [public static void main (string args []) [char c[] = [']', 'a', 'a'?' String S, = new String(c); String S2 = new String (Si); System. out pentla (SI); system. out. printly (S); Java Java

Page No:

[Construct string from subset of char array. class Substring Cons I public Static void main (String ags []) [byte ascii []= 365, 66, 67, 68, 69, 70]; String S, - new String (ascie); System out println(3); String So = new String (ascii, 2, 3); System out printly (5) ABCDEF String Length -no. of characters - longthes char chars[] = 3 'a', 'b', 'c'). String S = New String (chars); System. out printly (8. lengthes); For each string leteral in your pgm, Java authmatically constructs a string object. Thus go use a string object.

Eg: char chars [] = {'a', 'b', 'c'}; String 8, = new String (charge). String 82 = "abe": Huge String Literal

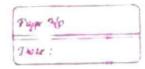

For objects, value Of () calls the tostring () method on the object. The toStringes method has this general form: String to String () Eg: demonstrates they overriding tostings for the 11 Override toStunges for Box class Class Box 3 double wt double ht double dt Bosc (double w, double h, double d) 3 wt = w; Rt = R; public String to String() I seturn "Dimensions are " + wt + "by" +

APPLET BASICS & METHODS

Applet Programming:

Applets are small apples that are accounted on internet server, transported over the internet, automatically installed & sun as part of a web document . An applet like any apple pgm, it can perform and metric opes, display graphics, play sounds, accept uses input, create animation & play instructive games.

Local & Remote Applets:

- embed applets into web pages in a ways.

into webpages (Local)

* we com down-load an applet from a remote
compider s/m & - then ombed into a webpage. (Remote)

Applets & Applications:

-> Applets -

the ext of the code.

+automatically call cartain methods of Applet

class to start & execute the applet code.

from inside a web page using a special feature known as HTML tag.

* cannot read from or weste to the files in the

local computer.

on the n/w.

* cannot sun any pgm from the local computer a Applets are restricted from using lebraries from The steps involved in developing & testing in applet

1. Building an applet code (your file)

2. Creating an executable applet (class file)

3. Designing a web page using HTHL tags 4. Preparing Applets tag.

5 Incorporating < APPLETS tag into the web page.

6. Greating the HTML file

I Testing the applet code.

Building Applet Code:

Applet Code uses the services of 2 classes, - Applet & Graphics from Java Class Library. The Applet class which is contained in the java applet package provides life & behavious to the applet through its methods such as inites, startes, pointes. When an applet is landed, Java automatically calls a series of Applet class methods for stasting Running & stopping the applet code.

> impost java applet *; 2 public class Simple Applet extends Applet 2 public void point (Graphics g) 2 q. drawstring ("A shoople Applet", 20,200)

This applet begins with 2 import etmits. The first imports the Abstract Window Todket (AWT) clayers. Applet interact with the use through the AWT. not through console based yo classes. The second import start imports the applet plag. which contains the class Applet Every applet that you cacate must be a subclass of Applet. The nextlene in the pgm declasses the class Simple Applet. This class must be declared as public, ble it will be accessed by code outside the pgm. Inside SimpleApplet, paintes is declared This method is defined by the AWT & must be overvisiden by the Applet paintes is called each time that the applet must redisplay its ofp. The painter method has one parameter of type Graphies. This parameter contains the graphics context, which describes the graphics ent. in which the applet is sunning. Inside paintes is a call to drawstringes, which 18 a member of the Graphics class. This method of ps a stoing beginning at the specified X, Y location General form: void drawstring (string msg, int x, inty) Applet Life Cycle Intralization stopes Tidle Stopped destroy () Exit of B.

Greating an Executable Applet obtained by compiling the source code of the applet. Compiling an applet is exactly the same as

Steps: 1. Mone to the de rectory containing the

source code & type the follo- and.

Javac HelloJava. java.
2. The compiled Offile called HelloJava.class is placed in the same directory as the source. 3.18 any error of msg is recieved, then

we must cheek for errors, correct them & compile the applit again.

Designing a Web Page

A webpage is basically much up of lext & HTML tags that can be interpreted by a web browses or an applet viewer. Web pages are stored using a file extension that such as MyApplet. Atmit heppages include both text that we want to display of HTML tags to Over browsels.

A webpage is marked by an operating HTHL lag < HTML) and closing HTML dag </ HTML> & & devided into the follo. 3 mayor sections.

1. Comment Coptional) 2. Head Coptional) 3. Body section.

Comment section: - what is going on in the web page. Comment line begins evith a 21 & endsowith a > . Head section: - starting (HEAD) tag & a closing HEAD> tag. - title for the page.

Fage No.

The text enclosed in the tags (TITLE) and (ITITLE) cuill appear in the Atle bar of the Web browser when it displays the page. Body section contains the entire info about the web page & Ms behavious. HI tag causes the < BODY> don't to be of CENTERY the largest size. KHI) Welcome (141) KH2>to < H6> to 1/2 /2 1/2 CICENTERY leduce the size (BR) of letters in the CAPPLET -... dext. XAPPLET > (BODY) The body shown abone display welcome Preparing Applet Tag The (APPLET) trug supplies the same of the applet to be loaded & tells the browser how much space the applet requires. The KAPPLET > tag given below specifies the min. sympts to place the Hello Java applet on the webpage. Hollow hello Java applet < APPE TA import Java aut *; import Java applet - *; CUDE = helloJava · class WIDTH = 400 public class hello Java extends HEIGHT = 200) Applet </APPLET> 2 public void paint (graphics g) Eg. drawstry (attelladare, (oo) (od)

98

This HTML code tells the browser to load the compiled Java applet helle Java class which is in the same directory as this HTML file And also specicifies the display area for the applet ofp as 400 pixels with & 200 pixels height. In corporating APPLET tag to HTML File Insert the <APPLET> tag in the

page at the place where the of of the applet must appear. Eg: <HTML> < ! This page includes a welcome title) <HEAD>

KTITLE)

welcome to Java Applets

void set Size (Dimension new Size) current size of a window. returns - The current size of the window contained within the width & Reight fields of a Dimension object. object. created, it will not be visible until you call set Visible (). void set Visible (boolean visible flag) Setting a Window's Title void setTitle (String new Title) new Title is the new title, for the window. Closing a Frame Window
When using a frame window, power must
Semone that window from the screen whomitis
closed, by calling set Visible (false). To intercept a window close event, you must implement the Window Listener interface hinds window Closings, you must remove the window From the screen.

Creating a trame Window in an Applet;

Creating a new frame window from within of Frame, Next overende any of the standard window methods, such as inster, starter, stopes & paintes. Finally, implement the window Closing of method of the Windowhistenes interface, calling sof Vierble (false) when the window is closed.

Once you destined a Frame subclass, create an object of that class when created, the window is given a default height & width. It can be reset by Calling setSize method. sec tgm. page 695

Handling Events in a Frame Window:

Since Frame 18 a subclass of Component, it inherits all the capabilities defined by Component. This means that we can manage a frame window that you create just like applet's mounwindow.

le; For eq: we can override paint() to display ofp Call repairtes when you need to restore the window.

Ref Pgm pg: 697

Working with Graphics: All ofp to a window takes place through a graphics context. A graphics context is encapsulated by

The Graphics class & is obtained in & ways.

It is passed to an applet when one of its vacuous

methods, such as pount() or update() is called.

Creating a frame Window in an Applet;

Greating a new frame window from within an applet is actually quite easy. Frost create a subclass of frame. Next overeide any of the standard window mothods, such as inster starter, stope & painter.

Finally, implement the window Closing () method of the Window Listenes interface, calling sof Visible (false) when the window is closed.

an object of that class. When created, the window is given a default height & width. It can be reset by calling setSize method.

See Pgm. page 695

Handling Events in a Frame Window:

Since Frame 18 a subclass of Component,
It inherits all the capabilities defined by Component.
This means that we can manage a frame window.
That you create just here applet's main window.

Le; for eq: we can override point() to display ofperall repaint() when you need to restore the window.

E override all event-handlers.

Ref pgm pq: 697

Working with Graphics:

All ofp to a window takes place through a graphics contest. A graphics contest is encapsulated by the Graphics class & is obtained in a ways.

It is passed to an applet when one of its vaccous methods, such as pount() or update() is called.

CSS

cascading Style Sheets (**CSS**) is a style sheet language used for describing the presentation of a document written in a markup language such as HTML.CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting by specifying the relevant CSS in a separate .css file which reduces complexity and repetition in the structural content as well as enabling the .css file to be cached to improve the page load speed between the pages that share the file and its formatting.

Separation of formatting and content also makes it feasible to present the same markup page in different styles for different rendering methods, such as on-screen, in print, by voice (via speech-based browser or screen reader), and on Braille-based tactile devices. CSS also has rules for alternate formatting if the content is accessed on a mobile device.

The name *cascading* comes from the specified priority scheme to determine which style rule applies if more than one rule matches a particular element. This cascading priority scheme is predictable.

The CSS specifications are maintained by the World Wide Web Consortium (W3C). Internet media type (MIME type) text/css is registered for use with CSS by RFC 2318 (March 1998). The W3C operates a free CSS validation service for CSS documents.

CSS has a simple syntax and uses a number of English keywords to specify the names of various style properties.

A style sheet consists of a list of *rules*. Each rule or rule-set consists of one or more *selectors*, and a *declaration block*.

Selector

In CSS, *selectors* declare which part of the markup a style applies to by matching tags and attributes in the markup itself.

Selectors may apply to the following:

- all elements of a specific type, e.g. the second-level headers h2
- elements specified by attribute, in particular:
 - o id: an identifier unique within the document, identified with a hash prefix e.g. #id
 - o *class*: an identifier that can annotate multiple elements in a document, identified with a period prefix e.g. .classname
- elements depending on how they are placed relative to others in the document tree.

Classes and IDs are case-sensitive, start with letters, and can include alphanumeric characters, hyphens, and underscores. A class may apply to any number of instances of any elements. An ID may only be applied to a single element.

Pseudo-classes are used in CSS selectors to permit formatting based on information that is not contained in the document tree. One example of a widely used pseudo-class is :hover, which identifies content only when the user "points to" the visible element, usually by holding the mouse cursor over it. It is appended to a selector as in a:hover or #elementid:hover. A pseudo-class classifies document elements, such as :link or :visited, whereas a pseudo-element makes a selection that may consist of partial elements, such as ::first-line or ::first-letter.

Selectors may be combined in many ways to achieve great specificity and flexibility. Multiple selectors may be joined in a spaced list to specify elements by location, element type, id, class, or any combination thereof. The order of the selectors is important. For example, div .myClass {color: red;} applies to all elements of class myClass that are inside div elements, whereas .myClass div {color: red;} applies to all div elements that are inside elements of class myClass. This is not to be confused with concatenated identifiers such as div.myClass {color: red;} which applies to div elements of class myClass.

The following table provides a summary of selector syntax indicating usage and the version of CSS that introduced it

For example, under pre-CSS HTML, a heading element defined with red text would be written as:

```
<h1><font color="red">Chapter 1.</font></h1>
```

Using CSS, the same element can be coded using style properties instead of HTML presentational attributes:

```
<h1 style="color: red;">Chapter 1.</h1>
```

The advantages of this may not be immediately clear but the power of CSS becomes more apparent when the style properties are placed in an internal style element or, even better, an external CSS file. For example, suppose the document contains the style element:

```
<style>
    h1 {
        color: red;
    }
</style>
```

All h1 elements in the document will then automatically become red without requiring any explicit code. If the author later wanted to make h1 elements blue instead, this could be done by changing the style element to:

```
<style>
    h1 {
        color: blue;
    }
</style>
```

rather than by laboriously going through the document and changing the color for each individual h1 element.

The styles can also be placed in an external CSS file, as described below, and loaded using syntax similar to:

```
<link href="path/to/file.css" rel="stylesheet" type="text/css">
```

This further decouples the styling from the HTML document and makes it possible to restyle multiple documents by simply editing a shared external CSS file.
